

QUEENSLAND SUGAR LIMITED | EXPORT FACILITY | CAIRNS

## PROJECT OVERVIEW

Our client came to us with the challenge of cantilevering and suspending a scaffolding system off the side of an active wharf to repair and blast and paint a fire pipe line.

Normally this would be a straight forward project for the Benchmark team, but it became thought provoking as the adjacent access road had to be kept clear for emergency vehicle access.

The Benchmark design and engineering team came up with a solution that solved the customer's problems and was also safe and efficient for the site team to install. This project would have been more difficult if it were not for the engineering data supplied by the scaffolding manufacturer that our team could rely on when pushing the components to their structural limits.

The Layher scaffolding system has the most rigorous testing regime of any system on the market and this allows the end user to have confidence in the product and know that they are getting the best possible solution.
