

PROJECT OVERVIEW

When the tender was released to supply and install scaffolding to the entire underside of the Burdekin Bridge on the Bruce Highway at Home Hill, The Benchmark Team knew they had a solution that would solve the client's problems and save them time and money in the meantime.

Benchmark designed the scaffolding system to be supported from monorails that were installed on either side of the bridge and suspended using chain driven girder trolleys to allow the system to move up and down the bridge span to access the entire work area.

The strength and light weight of the Layher Scaffolding system was the perfect solution for this project. The scaffolding has currently been installed for 4 years without incident and has withstood several severe tropical cyclones and floods.
