

FREYSSINET - SALTWATER CREEK

## PROJECT OVERVIEW

- This scaffold was constructed to allow the client to jack the bridge and replace the bridge bearings
- Scaffold was designed to allow the client to install their jacking frames without the interference of the scaffolding impeding their work.
- All scaffold was installed from a workboat.

Working all over Australia in different environments provides unique and valuable experiences for the Benchmark Scaffolding team. This project at Saltwater Creek was no different. We were tasked with providing scaffolding access so our client could jack up the bridge and replace the bridge bearings. The scaffold was designed to allow the client to install their jacking frames without the interference of the scaffolding impeding their work. Due to the environment we were in we had to install the scaffolding from a work boat. Because of our knowledge and expertise in delivering scaffolding projects in any environment this job was completed on time and without incident.
