

QSL - LUCINDA SHIPLOADER

PROJECT OVERVIEW

- Suspended scaffolding at the end of shiploader boom
- Out over water
- For maintenance and repairs

During shutdowns and maintenance work it is critical to understand your clients needs, so operations can return to normal as quickly as possible. Time is money with all breakdown work so minimising our time on site was a key element for repairs to this shiploader boom.

Providing a suspended scaffolding option allowed the team to do exactly that. We were able to build the suspended structures during an 8 hour window which provided plenty of time for the maintenance team to carry out their repair work. Using our experience with this type of work coupled together with our 3D design animation provided confidence and clarity to carry out the works safely and efficiently.
