

## PROJECT OVERVIEW

- Scaffold was built for construction of new auto claves and flash vessels
- Installed a temporary works building which was insulated and airconditioned to prepare rubber linings
- The scaffold was also needed to provide temperature control in the work areas

We work for some of the largest mining and industrial companies in Australia. A lot of this has happened due to the relationships we have built and understanding our clients needs. This project was no different as we were contracted to provide scaffolding for the construction of new auto claves and flash vessels. Usually we are providing scaffold for access for maintenance and repair work. This was slightly different as the scaffolding was built to provide shade and temperature control in the work areas. The flash vessels needed to be cool enough to install rubber linings.
